UTIP Working Paper No. 53

Abstract:

This paper was prepared for the United Nations Research Institute on Social Development. It provides evidence on the relationship between economic inequality and political regime. Where much of the literature argues that democracy is egalitarian, we find that indeed it is not, and we suggest that the conventional argument is an artifact of the data scales commonly in use. Using the latest UTIP-UNIDO data set on economic inequality (Kum 2008) and an original, categorical data set on regimes, we find that particular regime types do influence the level of inequality. In particular, communist countries and Islamic republics are more equal than their economic characteristics would predict, while conservative (as distinct from social) democracies are somewhat *less* equal than otherwise expected. Further, within democratic countries with changing governments and policies, we find short-term shifts in the level of inequality. However, these are generally smaller than those associated with major differences of regime type.

Introduction

This paper provides evidence on the relationship between economic inequality and political regime. Where much of the literature argues that democracy is egalitarian, we find that indeed it is not, and we suggest that the conventional argument is an artifact of the data scales commonly in use. Using the latest UTIP-UNIDO data set on economic inequality (Kum 2008) and an original, categorical data set on regimes, we find that particular regime types do influence the level of inequality. In particular, communist countries and Islamic republics are more equal than their economic characteristics would predict, while conservative (as distinct from social) democracies are somewhat *less* equal than otherwise expected. Further, within democratic countries with changing governments and policies, we find short-term shifts in the level of inequality. However, these are generally smaller than those associated with major differences of regime type.

The paper is structured as follows: we first discuss the literature on democracy, inequality and political regimes; we then describe our political classification scheme and methodology; next, we present a model of economic inequality based on regime type and economic and demographic indicators. We conclude with policy implications of these findings.

Democracy and Inequality in the Political Science Literature

Much of the literature on democracy and inequality finds that democracy and equality are positively related. Timmons (2008) divides the theoretical work on this relationship into three categories: papers citing a median-voter mechanism of income redistribution, according to which the government intervenes as mean incomes diverge from median incomes, papers citing political competition as a mechanism to induce public support, which induces an increase in public services, and papers citing labor market regulation as the mechanism whereby inequality is reduced in democratic governments.

Numerous empirical studies report a positive relationship between democracy and equality. Reuveny and Li (2003) argue that democracy *and* trade reduce inequality². Lee (2005) examines the interaction between democracy, public sector size, and inequality, concluding that the public sector in democracies reduces inequality. Chong (2004) uses a variety of techniques to identify an inverse U-shaped relationship (increasing then decreasing in inequality) in the period from 1960 to 1997. Chong points out both the differences in time periods studied in various works on the relationship between democracy and inequality, as well as the shortcomings of using the Deininger and Squire Gini measures of inequality³.

Some of the literature investigates a causal relationship the other way: between inequality and democracy, asking whether inequality results in more democracy or less. Acemoglu and Robinson (2001) assume a relationship between non-democracy and inequality, their idea being that the elite in unequal societies prevent consistently redistributive democracy from emerging⁴. Bourguignon and Verdier (2000) examine the relationship between democracy, inequality and economic development, in a model where political participation is determined by the level of education. Based on this model, they argue that higher income per capita positively affects democracy and growth, while higher levels of inequality negatively affect democracy and growth.

From this literature, the notion that democracy promotes equality has achieved the status of a conventional wisdom, yet some skeptics remain. Gradstein and Milanovic (2000) provide an extensive literature review, covering fifty years. Of this literature, they state:

To sum up, while the earlier research failed to detect any significant correlation between democracy and inequality, more recent studies based on improved data sets and bigger data samples typically cautiously suggest existence of a negative relationship between the two. Two hypotheses seem to be especially promising in the light of this recent research:

² This study uses the World Bank Gini as computed by Easterly (a revised version of Deininger and Squire) and the Polity III measure of democracy.

³ Chong uses Freedom House and Polity IV measures of democratization.

⁴ In a later paper (2002), the same authors argue that reduced inequality follows redistribution that occurs after democratization, which is an alternative explanation for the Kuznets curve. Acemoglu and Robinson use a measure of democracy based on voting rights in Western countries..

one that defines democracy in terms of the length of democratic experience, and another that specifies a curvilinear relationship between democracy and inequality (p. 21).

Yet Gradstein and Milanovic are themselves skeptics: they look at the Eastern European transition economies, finding evidence of rising inequality in the democratic transition.⁶

A major problem in assessing levels of inequality and their relationship to political regimes is the reliability of the measures. Problems with the Deininger and Squire dataset on income inequality and its successors are well known. These include sparse data coverage and heterogeneous methods and definitions, leading often to gross inconsistencies between the Deininger-Squire comparisons and those of other data sets, such as the Luxembourg Income Studies (Galbraith and Kum 2003). These issues raise the question of whether widely-used measures of economic inequality are truly consistent, reliable, and comparable from one country to the next. The UTIP-UNIDO data set recently updated by Kum (2008), provides an alternative approach that is dense, consistent, and comparable between-countries. It therefore makes possible close observation not only of differences in inequality between countries with differing regime types, but also of changes in inequality associated with political change over time.

The other measurement problem concerns the characterization of political regime, and particularly the meaning of the term “democracy.” This meaning has changed over time, while generally drawing on concepts of participation (voting rights and civil liberties), competition (presence of other parties), and free and fair elections. In contrast to an inequality measure, some of the scoring (and weighting) of these characteristics is inevitably subjective. Some indices, which are discussed below, score the degree of democracy on a continuum, while others use a binary score: either a country is a democracy or not. Continua are particularly problematic, since they tend to treat authoritarian regimes of all types as though their most important characteristic is simply how far removed they may be from democracy. No distinction is drawn, in particular, between fascism and communism, despite the diametric ideological opposition of these two regime types. In addition, as Gradstein and Milanovic point out, the relationship

⁶ The Gradstein and Milanovic use the Freedom House index as a measure of democratization and Milanovic (1998) and the DEC database for inequality measures.

between democracy and inequality is cumulative: democracy is not revolution, and should work its effect on economic outcomes only over time.

Thus a first step toward an improved look at the effect of political regime on inequality requires creating a reliable and complete typology of political regimes. Such a typology need not and should not presume anything about the direction of effect of any particular regime type on inequality: that much can be determined from the data. Nor should it place regimes on a scale, as indexes or continuous classifications schemes do, for this implicitly imposes an ordering of effect, without reference to the data. Rather, a typology should simply attempt to distinguish between regime types that – for whatever reason – may reasonably be expected to conduct economic policy in internally similar and externally distinctive ways. It is a grouping system – not more or less. This is what we attempt to provide.

Regime type classification began in the 1950s and 1960s with Lipset's (1959) and Cutright's (1963) examination of democracy and modernization. This type of work was furthered by Dahl' (1971) and Gurr (1974) and made more usable by Gurr (1990) with the creation of the Polity II database, which extended previous work to cover all years within a specified time period, rather than just measuring regime persistence. Gastil (1991) followed with the creation of the Freedom House database. Since then, additional work has been done to refine or re-specify regime classification systems.

Today the most widely used political regime databases are those of Freedom House, Polity, and Vanhanen. All grade political regimes on continua. Freedom House looks at political and civil rights, using a subjective scale to rank degree of democracy, partly in terms of election outcomes, partly in terms of balance of power. The Polity measure of democracy is an additive number based on the degree of competitiveness of political participation and government recruitment and the degree of constraints on the chief executive. Vanhanen also looks at competition and participation, measuring percentage votes for smaller parties and percentage of adults that voted in elections.

Cheibub & Gandhi (2004) divide regime types between authoritarian and democratic, based on data taken from Przeworski et al. (2000)^{8,9}. In further sub-

⁸ Alvarez et al. (1996) previously make a similar dichotomous classification scheme, focusing on the definition of democracies using criteria related to contestation.

categories, Przeworski et al. (2000) classify regime types in terms of their colonial past or civil war status, and also in terms of majority religion, although these categories are not at the forefront of the classification scheme. Przeworski et al.'s work on democracy and development is dichotomized to some degree between democracy and dictatorship. However, because inequality is not a central focus of their work, the authors do not classify regimes by ideology and therefore the effect of a full range of regime types is not examined. They nevertheless find that both democracies and dictatorships are more unstable in countries with high levels of inequality.

Hadenius and Teorell examine authoritarian regimes, classified in terms of hereditary succession, use of military force, and the presence or absence of popular elections. Authoritarian regimes are identified using the Polity/Freedom House definition of authoritarian regime type. Separate categories are used for democracy as a whole, military with party classification, monarchy with party classification, theocracies, transitional regimes, civil war, and foreign occupation; specifically, the Hadenius and Teorell categories include the following: Limited Multiparty, Partyless, No-Party, Military, Military No-Party, Military Multiparty, Military One-party, One-Party, Other, One-Party Monarchy, Monarchy, Rebel Regime, Civil War, Occupation, Theocracy, Transitional Regime, No-Party Monarchy, Multiparty Monarchy, Multiparty Occupied, and Democracy.

The World Bank Database, created by Beck, Keefer and Clarke (2006) includes descriptive information about elected executive and legislative officials and their and their parties as well as indices regarding election competitiveness and government stability. For comparison to our regime classification scheme, we used the Executive Index of Electoral Competitiveness, which ranks the executive electoral process between 1 and 5 for autocracy and between 6 and 10 for democracy.

There are two main ways in which we depart from previous regime classification schemes. First, we use categorical variables to classify separate regime types rather than continuous variables that rank the degree of democracy. Second, we classify regimes based on a combination of state ideology and/or type of government, rather than by

⁹ Przeworski et al. look at regime transition effects, which we do not.

common criteria such as the presence or absence of elections, or evaluations of civil and political liberties.

“Ideology” is a loaded term, but here we wish to define it as in Skopcol (1985):

I prefer to reserve the term “ideology” for idea systems deployed as self-conscious political arguments by identifiable political actors. Ideologies in this sense are developed and deployed by particular groups or alliances engaged in temporally specific political conflicts or attempts to justify the use of state power. Cultural idioms have a longer-term, more anonymous, and less partisan existence than ideologies. When political actors construct ideological arguments for particular action-related purposes, they invariably use or take account of available cultural idioms, and those idioms may structure their arguments in partially unintended ways.

Ideology is used as justification for power, and through the use of ideology, state actors choose to use or not use cultural idioms that are conceived of as expressions of ideology, in the degree of enforcement of freedoms, in degree of political power provided to citizens, and in the general structure of government. We apply distinctions in ideology when they are potentially relevant in terms of inequality -- in specifying a distinction between communist and social democratic regimes, for example. We do not apply distinctions when they are not as relevant, as in regimes which follow a specific national political ideology that does not extend to other states.

Political Regime Classification and Methodology

We further depart from the “degree of democracy” method of classification used in Freedom House and Polity databases to the extent that we do not impose any ordering on our categories. Our maintained hypothesis is simply that differing regime types are likely to differ systematically in the amount of inequality present in the societies they govern; we say nothing *a priori* about the direction or the magnitude of these differences, which we allow to be determined by the evidence of the data.

Gøsta Esping-Andersen’s (1990) body of work provides a main point of reference in the area of political-economic welfare state classification, and therefore in terms of

specifying democracies. Esping-Andersen frames the state through three categories of regime codification in terms of social stratification: the liberal state, in which modest social-insurance plans dominate; the conservative state, in which status differentials are preserved; and social democratic states, in which universal social rights are expanded (Ibid, p. 26). We use Esping-Andersen's social democratic category of regime classification for particular nations and classify the rest (both conservative and liberal states) as conservative democracies. The reason for including conservative and liberal states together is that we did not have a clear way to distinguish between the remaining two categories^{10,11}.

As in Alvarez, Cheibub, Limongi and Przeworski (1996), we classify as democratic regimes those that hold fair elections for the chief executive office and for the legislative body (Ibid, p. 5). False elections do not qualify: a fair election is uncertain beforehand, irreversible afterward, and repeatable. Unlike Alvarez et al., however, we reserve a separate category for "one-party democracy", in which opposition parties are prohibited from participating in elections, but in which fair elections are conducted all the same.

Whereas Freedom House and Polity treat all 'authoritarian' regimes as being essentially alike – as differing only in degree-- our approach allows distinctions according to ideology and type of government, recognizing that communist regimes and Islamic republics engage in characteristic welfare policies which are radically different from those (not) pursued by military dictatorships and other power-based authoritarian regimes.

Power-based authoritarian regimes, coded in our database as military dictatorships and dictatorships, are found mainly in developing countries, with non-military

¹⁰ Gough and Wood (2004) extend Esping-Andersen's work to developing countries that lack welfare states in the Western sense of the term. An additional framework for conceptualizing welfare regimes is given, with the informal security regime, and the insecurity regime for developing countries. Countries that face non-Western welfare state regime types may be subject to greater risk in terms of illness, injury, violence, unemployment, and high food prices, and/or may have other, non-state methods of subduing those risks. Although an intriguing extension, this typology is not specific enough for our purposes.

¹¹ Manufacturing wage inequality, as a proxy for overall inequality, is not directly associated with the broad concepts of well-being such as the Human Development Index. This is to a large degree because the HDI looks at, among other measures, GDP per capita and not inequality, therefore considering richer countries to have higher HDI indexes. Our measures of inequality cover both rich and poor countries, pointedly looking beyond average measures of income.

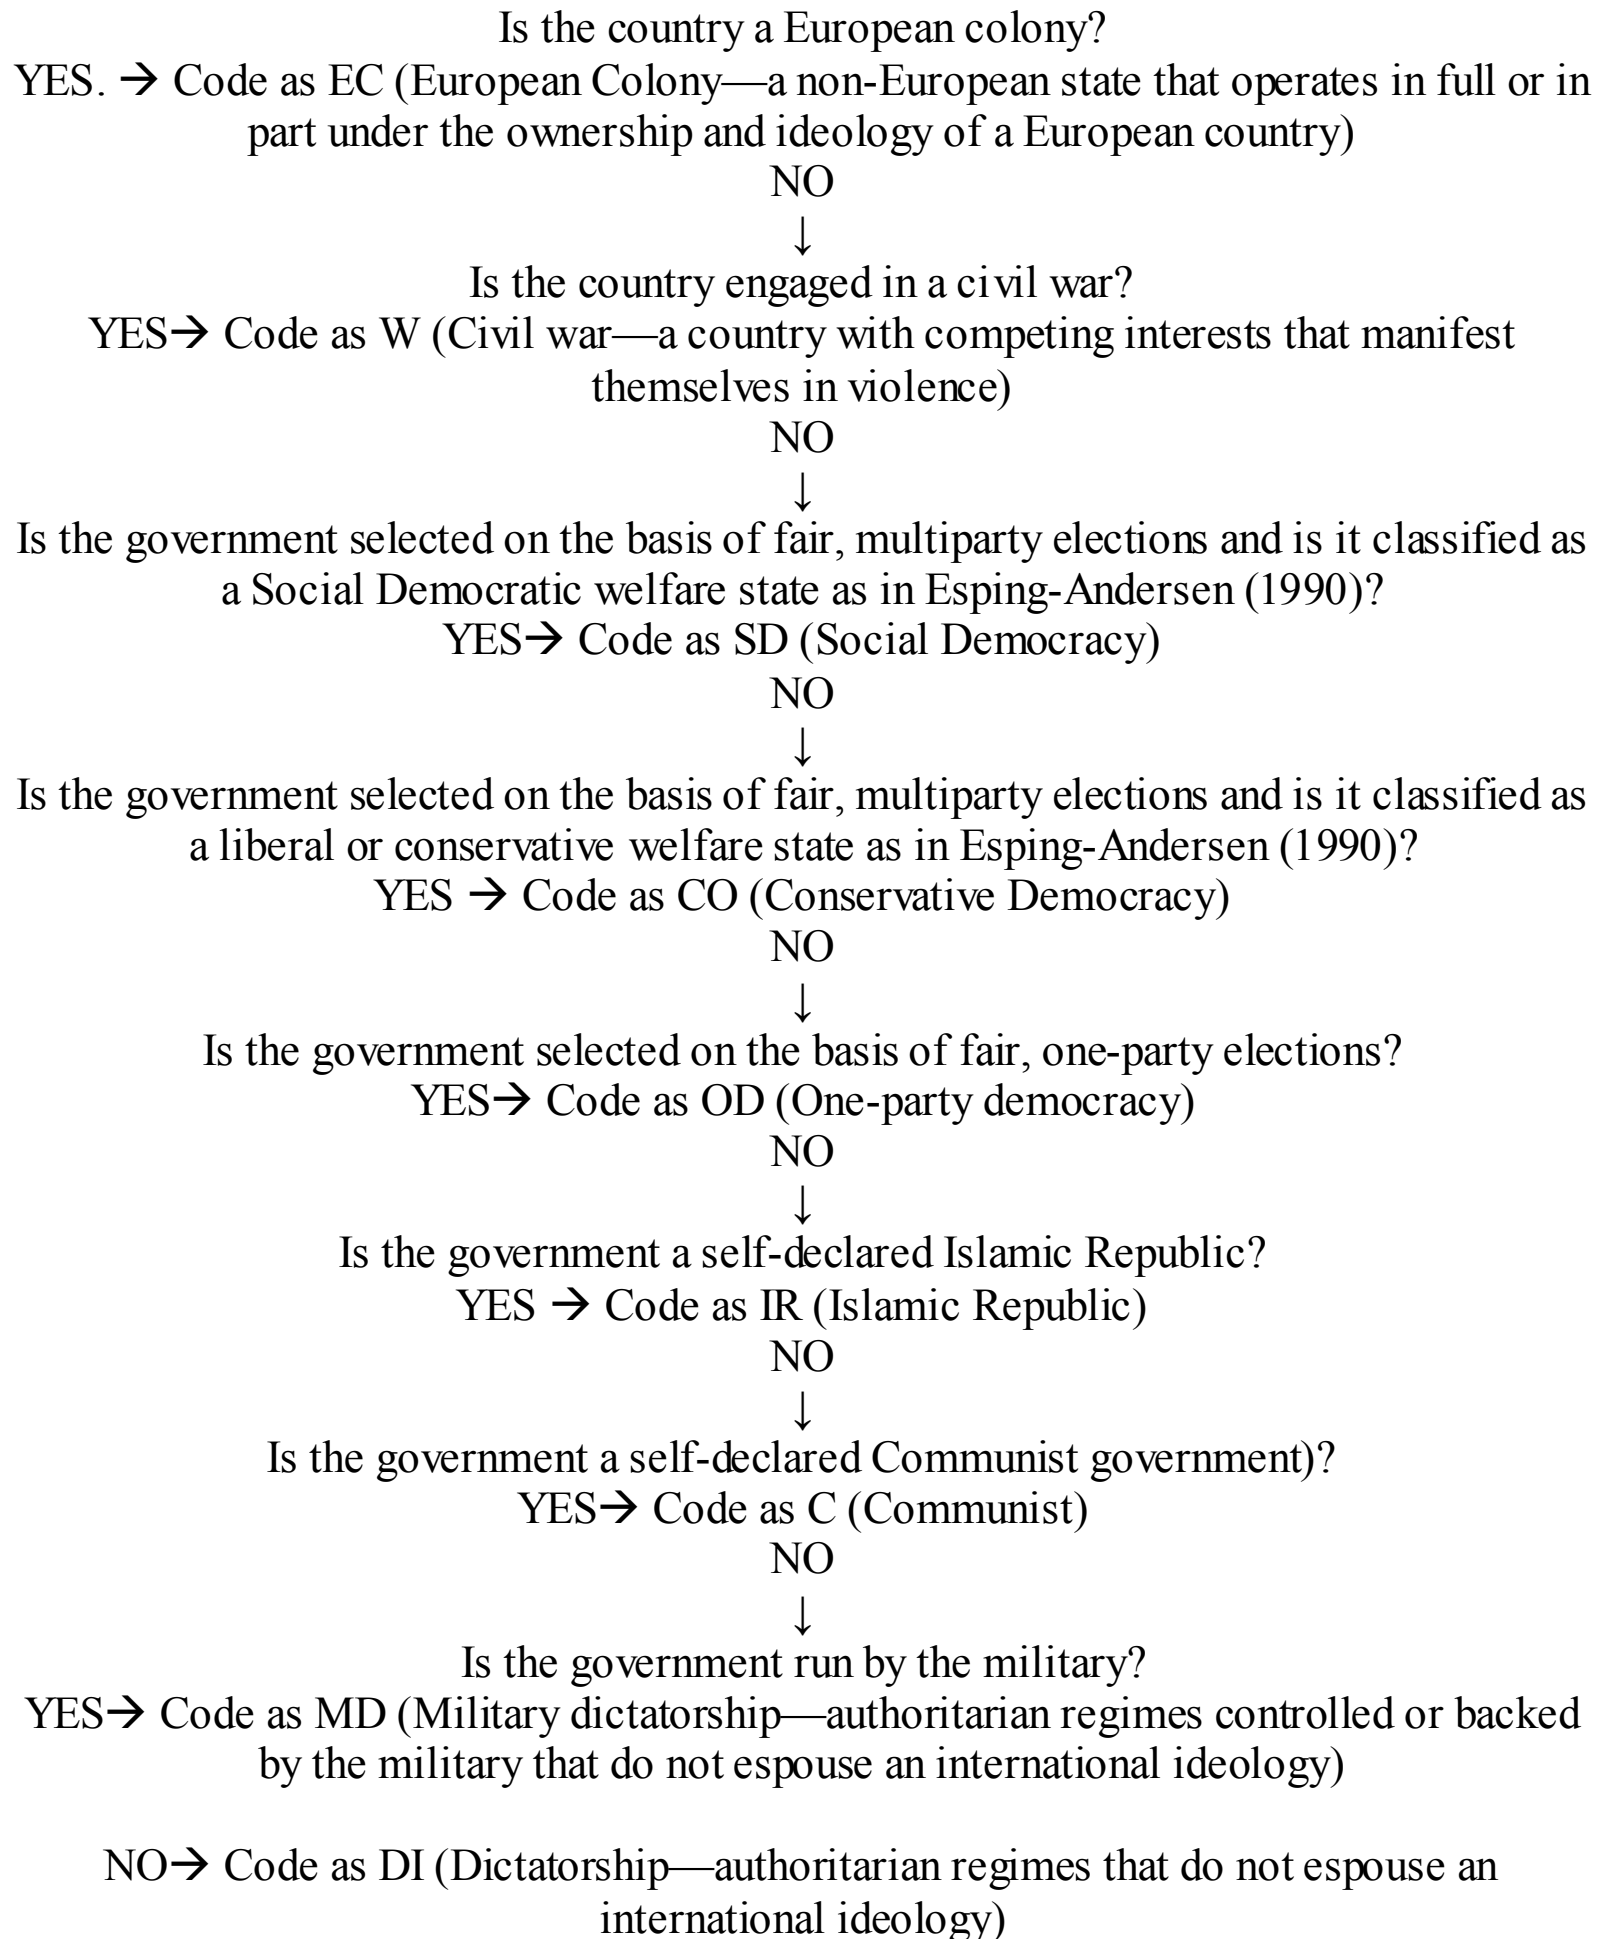

dictatorships primarily found in Africa and the Middle East, and military dictatorships spread more widely throughout the developing world. The most insecure regimes, in a state of civil war, are found mainly in Africa.

States engaged in civil war face struggles that supersede the ability of the state to impose political rule over the population. Therefore, they face ideological and political disorder, which flow over into the social and economic arenas. European colonies also lack an own-state ideology, since they are by definition governed from outside. Many of those were governed in practice according to the creeds of laissez-faire that prevailed in nineteenth century Europe, while in modern times the few that remain (mostly small island states) partake of the social welfare systems present in the mother country.

So far we have discussed political regime type. It is however useful here to introduce a second concept, which we call “policy type.” Policy types may be defined as particular constellations of action, undertaken by a regime; in economics one may speak of neoliberal policy, Keynesian policy, heterodox policy and so forth. Where political regime classification is based on the characteristics of the state, policy type is related to the actions of the government. In many cases, of course, the former determines the latter. But in democracies, especially, policy types change while the political regime stays constant – that is what democracy is about. It is therefore useful, particularly for an analysis of the effect of changing governments in a democracy, to examine changing policy types as well as differences and changes in political regime. However, at the same time, changes in policy happen more frequently and are much more difficult to distinguish and characterize accurately than changes in regime type, so we leave that exercise for a later project. Galbraith (2008) offers some observations based on work on Brazil and Mexico: it is not surprising that the effect of transient policies (such as heterodox stabilization programs) on inequality is both smaller and less enduring than the effect of regime changes (such as revolution or coup d’état.)

Our regime classification rubric follows.

Regime Classification Rubric

Analysis and Results

Our analysis proceeded in two steps. First we regressed the UTIP-UNIDO inequality measures on our categorical measures of regime type – a simple dummy-variable analysis intended to establish whether significant differences between regime types exist. We then added a raft of conditioning variables to the regression, following Galbraith and Kum (2004) and other sources. We later extended the analysis to other inequality data sets (Deininger and Squire) as a comparison.

The conditioning variables in the second phase included: general government final consumption expenditure (% of GDP), aid per capita (current US\$), agricultural machinery (tractors per 100 sq. km of arable land), cereal yield (kg per hectare), fuel exports (% of merchandise exports), fuel imports (% of merchandise imports), GDP per capita (constant 2000 US\$), gross capital formation (% of GDP), urban population (% of total), degree of trade openness (imports plus exports over GDP), and manufacturing employment as a share of population. Left to right position of the chief executive and of the largest party (from the WDI database) were also included.

Regional variables consisted of indicators for location in: North America, Central and Eastern Europe, Sub Saharan Africa, Latin America/ Caribbean, East Asia, Middle East/North Africa, Oceania, Western Europe, the former USSR, and South Asia. Year indicators for 1963 through 2005¹² were also included. These independent variables were included with each political database in stepwise regression (SAS).

We wanted to include indicators of social protection as independent variables, but data in this area was inadequate for our purposes. Recently, the Asian Development Bank created an index for social protection in Asia, with ratings on social insurance and welfare programs, among others, but years covered include only 2002-3 and 2004-5. Good time series data on these types of programs are not available. Therefore, we are unable to control for social protection and its effect on inequality; in any event, it is likely that the effect of social protection is substantially captured by the indicator of political regime, since regimes differ perhaps most greatly on precisely this line of policy.

¹² A continuous time variable gives, generally, the same results, but individual year dummies are generally more informative.

The baseline regression used our political regime classification and just a few independent variables, including manufacturing employment as a percentage of the population, degree of openness, and log of GDP per capita. Table One shows the results of a regression of regime types and years on the (log of the) UNIDO Theil Statistic. Regime types that were negatively related to inequality included, in order of the size of the effect, communism, Islamic republics, social democracies, European colonies, civil war and military dictatorships

Table One. Regression: Log UTIP-UNIDO on Regime Types, Manufacturing Employment, Openness, and Log GDP per capita.

Table Two presents the results of a step-wise regression exercise including regime types and time dummies. It is noteworthy that the movement of inequality is now dominated by a common global time element, yet regime types remain strongly significant and with the same general order of effect. Non communist dictatorships now show as being associated with the highest levels of inequality, other things equal, while communist regimes continue to have the lowest levels.

Table Two. Regression: Log UTIP-UNIDO on Regime Types and Time Effects

	Parameter Estimate	T Value	P Value

Pr > F		<.0001	

The next regressions incorporated all the independent variables listed above and our political regime classification and were run against the UTIP-UNIDO Theil index. We found that, controlling for location, time, and other socioeconomic variables, conservative democracies, one-party democracies, and European colonies were more unequal than one might otherwise expect, while dictatorships, military dictatorships, and Communist regimes were more equal. Social democracy no longer has an effect on inequality different from what is captured by the socioeconomic indicators – some of which may, of course, be the product of social-democratic governance. Now, of most variables having a negative relationship to inequality, as in the baseline regression, the regime variables were evenly split between being positively and negatively related to inequality. This suggests that the other variables are picking up a proportionate share of the variance in the direction of higher inequality. The regional variables, of course, act as a kind of normalization for the political characteristics that any large region (such as Latin America or Africa) may share in common.

Significant variables for this regression, and (for the most part) for regressions using other regime classification schemes (discussed below) included: manufacturing employment as a percentage of the population, degree of openness, agricultural machinery, urban population, fuel exports, general government final consumption expenditure, log of GDP per capita, location in Western Europe, location in Oceania, Central and Eastern Europe, North America, Middle East North Africa, East Asia, the left to right position of the Chief Executive, and the years 1995, 1996, and 1999.

Countries with a higher percentage of manufacturing employment were more equal, as were locations with a greater percentage urban population. Countries that exported more fuel were also more equal, as were countries with greater government expenditure. Countries that were more open to trade and that had more agricultural machinery were more unequal, as were countries with a higher per capita income – contrary to the usual Kuznets result. Finally, as political parties of the chief executive became more left, they also became more equal.

Not surprisingly, as regions and apart from political regime, Western Europe, Oceania, Central and Eastern Europe, North America, and East Asia were more equal, while Middle East North Africa and European Colonies were less so. It may be that

when scholars speak of democracies as being more economically equal, they are confounding regime effects with regional effects.

The world became more unequal in the nineties. Table Three reflects this via significant time effects for the late 1990s despite all of the controls.

When we regressed the same variables, including our political regime classification database, using the Deininger and Squire Gini coefficients as the dependent variable, we found somewhat different results. After controlling for location, time and other sociopolitical characteristics, we the model found that dictatorships were more unequal, and Communist regimes were more equal. Fewer variables were significant. In terms of regions, Latin America, Sub Saharan Africa, Oceania and East Asia were more unequal. Countries with a greater percentage of manufacturing employment and a higher cereal yield were more equal. None of this is very inconsistent with the findings from UTIP-UNIDO, the major difference is that the weaker data set supports far fewer reasonable statistical inferences. Again, this is not surprising: the number of observations available for use with the Deininger and Squire data set was less than half of the number used in our regression on the UNIDO Theil data set. .

Table Three. Stepwise Regression: Log UTIP-UNIDO on Regime Type and Conditioning Variables, including Time Effects

	Parameter Estimate	T Value	P Value

Results Using Other Political Classification Schemes

Results from stepwise regression of the log of the UNIDO Theil statistic using our regime classification were similar to regressions using the Cheibub and Gandhi, Polity/Freedom House, and Hadenius regime classifications, but opposite to the Vanhanen and World Bank regime classifications. Vanhanen and the World Bank showed that democracies reduced inequality, while dictatorships increased inequality, while we found that democracies (conservative democracies) increased inequality while dictatorships reduced inequality.

Explanatory power and significant variables were similar to our results across regressions. R^2 was over or around 60% for all. Results follow.

Conclusion

We find that, using the UTIP-UNIDO Theil inequality measure and our own political regime classification scheme, and controlling for location, time, and other socioeconomic variables, that regime type had an important effect on economic inequality. Conservative democracies, one-party democracies, and European colonies tended to be more unequal than one would otherwise expect, while communist countries, Islamic republics and (to a much lesser degree) certain dictatorships were more equal than expected. Social democracies are intrinsically egalitarian, but measures of socioeconomic conditions pick up the effect so that the regime type has no measureable independent effect on the inequality variable once those conditions are taken into account. Results using the Cheibub and Gandhi, Polity/Freedom House, and Hadenius political regime classification schemes along with the UTIP-UNIDO Theil inequality measure, were in line with our findings.

Results using the Deininger and Squire data set were much weaker and at odds with our findings in some respects, as were results using the Vanhanen and World Bank regime classifications with the UTIP-UNIDO Theil inequality measure.
